

Risk Based Approach towards Transparency on Non-Equity Investment Products

Marcello Minenna

Syllabus

Preliminaries

- regulatory framework
- products' risk-return profile VS investors' risk-return profile

Three-pillars approach

- financial structures
- 1st Pillar: unbundling and performance scenarios
 - return target products
 - unbundling
 - probabilistic performance scenarios
 - risk target and benchmark products
 - model risk assessment
- 2nd Pillar: the degree of risk
 - risk target and benchmark products
 - mapping
 - migration
 - return target products
- 3rd Pillar: recommended investment time horizon
 - risk target and benchmark products
 - first passage time
 - connection between probability, volatility and costs
 - characterization of the necessary condition in the space of returns
 - how to determine a consistent series of Time Horizons
 - return target products

Marcello Minenna

2

Preliminaries

The transparency on the risk profile of non-equity investment products is based on three synthetic indicators (three pillars) – defined through the development of specific quantitative methods – in order to allow investors to take informed investment decisions.

~~Traditional narrow
description of all
possible risks
associated with
a financial product~~

Synthetic indicators
robust,
objective
and backward
verifiable

Marcello Minenna

3

Preliminaries

Consob Annual Report 2008 Speech by the Chairman to the Financial Market

“The inclusion of indicators on performance scenarios, the degree of risk, costs and recommended investment time horizons in information documents will allow investors to assess and compare investments based on standard criteria.

This is a new approach on the international scene that meets the needs of a market, such as in Italy, where a high capacity for investment tends to privilege direct forms of investment”.

Marcello Minenna

4

Preliminaries

Consob Annual Report 2009 Speech by the Chairman to the Financial Market

“The weight of structured bonds on the total wealth of Italian families has been progressively increasing in the last decade This is a phenomenon that Consob is carefully monitoring, having considered the presence in retail investors portfolios of risky and illiquid bonds that do not offer an adequate return with respect to Government bonds yields.”

Marcello Minenna

5

Preliminaries

European Commission The EU Single Market Communication from the Commission on Packaged Retail Investment Products

The level of protection afforded to the retail investor should not vary according to the legal form of these products [...]

This work:

- will provide a market (for packaged retail investment products) in which regulatory arbitrage does not drive savings towards particular products;
- has the objective to introduce a horizontal approach that will provide a coherent basis for the regulation of mandatory disclosures and selling practices at European level, irrespective of how the product is packaged or sold.

Marcello Minenna

6

QdF Consob n. 63: A Quantitative Risk- Based Approach to the Transparency on Non-Equity Investment Products

Transparency regulation on the risk profile of non-equity investment products should be standard and translate into suitable regulatory provisions a coherent approach to risk measurement and to its correct representation to the potential investors.

This will create a context compatible with the concrete realization of a levelled playing field and with the prevention of any regulatory arbitrage which could arise due to the fragmentation of the current regulation.

[...] the only solution is represented by a thorough revision of both the European and the Italian regulatory framework in the direction of a single directive on the transparency for non-equity investment products.

Preliminaries

Update on Commission work on
Packaged Retail Investment Products
16 december 2009

Pre-contractual disclosures

Common elements to allow for comparisons to include the structure of documents, order of sections, use of plain language, and focus on key information about nature of product, its risks, potential performance and costs.

QdF Consob n. 63: A Quantitative Risk-Based Approach to the Transparency on Non-Equity Investment Products

The regulatory choices Consob has made over time reflect its view of the prospectus as the privileged channels to realize an effective transparency both in the offering and in the distribution of non-equity investment products.

Such approach, developed and progressively implemented by Consob, is based on three pillars, corresponding to three synthetic indicators defined through the application of specific quantitative methods.

The three pillars fully define the contents of a product information sheet which should become the core of the prospectus and of the other transparency documentation intended to effectively.

Marcello Minenna

7

Preliminaries

Proposal of the European Commission for a
DIRECTIVE OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL
amending Directive 2003/71/EC on the PROSPECTUS (September 2009)

Whereas (10):

“The summary of the prospectus is a key source of information for retail investors. It should be short, simple and easy for targeted investors to understand. It should focus on the key information that investors need in order to be able to make informed investment decisions. Its content should not be restricted to any predetermined number of words. The format and content of the summary should be determined in a way that ensures comparability with other investment products that are similar to the investment proposal described in the prospectus.”.

Marcello Minenna

8

Preliminaries

FINANCIAL REGULATORY
REFORM: A NEW FOUNDATION

Protect consumers and investors from financial abuse.

To rebuild trust in our markets, we need strong and consistent regulation and supervision of consumer financial services and investment markets. ...

We must promote transparency, simplicity, fairness, accountability, and access. We propose:

...

- Stronger regulations to improve the transparency, fairness, and appropriateness of consumer and investor products and services
- A level playing field and higher standards for providers of consumer financial products and services, whether or not they are part of a bank.

Marcello Minenna

9

Preliminaries

FINANCIAL REGULATORY
REFORM: A NEW FOUNDATION

Transparency.

We propose a new proactive approach to disclosure.

[...] all disclosures and other communications with consumers be reasonable: balanced in their presentation of benefits, and clear and conspicuous in their identification of costs, penalties, and risks.

Mandatory disclosure forms should be clear, simple, and concise.

Moreover, reasonableness does not mean a litany of every conceivable risk, which effectively obscures significant risks. It means identifying conspicuously the more significant risks. It means providing consumers with disclosures that help them to understand the consequences of their financial decisions.

Marcello Minenna

10

Syllabus

Preliminaries

☒ regulatory framework

☐ products' risk-return profile VS investors' risk-return profile

Three-pillars approach

☐ financial structures

☐ 1st Pillar: unbundling and performance scenarios

- return target products
 - unbundling
 - probabilistic performance scenarios
- risk target and benchmark products
- model risk assessment

☐ 2nd Pillar: the degree of risk

- risk target and benchmark products
 - mapping
 - migration
- return target products

☐ 3rd Pillar: recommended investment time horizon

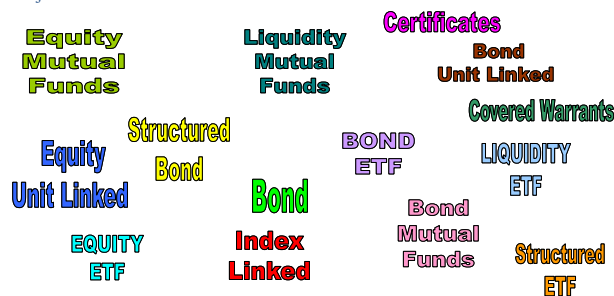

- risk target and benchmark products
 - first passage time
 - connection between probability, volatility and costs
 - characterization of the necessary condition in the space of returns
 - how to determine a consistent series of Time Horizons
- return target products

Marcello Minenna

11

Preliminaries: regulatory framework

The implementation of the disclosure regulation on the risk-profile of non-equity investment products should allow the investor, even assisted by a financial advisor, to choose the financial product more suitable to his investment objectives.

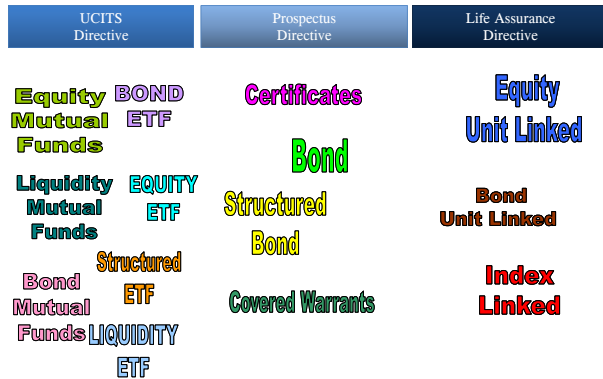

Marcello Minenna

12

Preliminaries: regulatory framework

Three different directives for the same financial engineering

Marcello Minenna

18

Three-pillars approach

Three-pillars approach

The three pillars are closely linked together and offer to investors an organic and internally consistent representation of the risks, costs and potential performances of the product over the recommended investment horizon.

Syllabus

Preliminaries

- ☐ regulatory framework
- ☐ products' risk-return profile VS investors' risk-return profile

Three-pillars approach

1 financial structures

1st Pillar: unbundling and performance scenarios

- return target products
 - unbundling
 - probabilistic performance scenarios
- risk target and benchmark products
- model risk assessment

2nd Pillar: the degree of risk

- risk target and benchmark products
 - mapping
 - migration
- return target products

3rd Pillar: recommended investment time horizon

- risk target and benchmark products
 - first passage time
 - connection between probability, volatility and costs
 - characterization of the necessary condition in the space of returns
 - how to determine a consistent series of Time Horizons
- return target products

Three-pillars approach: financial structures

The three-pillars approach is based on the preliminary classification of the products into three types of financial structures:

Three-pillars approach: financial structures

"Risk target" products invest in any market and any financial instrument in order to optimize over time a given target in terms of risk exposure.

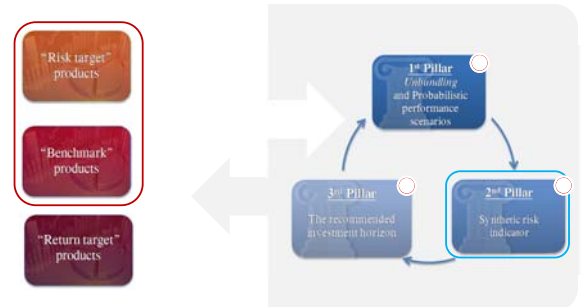

"Benchmark" products have an investment policy which is anchored to a benchmark, and in relation to this benchmark the asset management style may be either passive or active.

"Return target" products feature a financial engineering (and, in some cases, a consequent investment policy) aimed at pursuing a minimum target return on the financial investment.

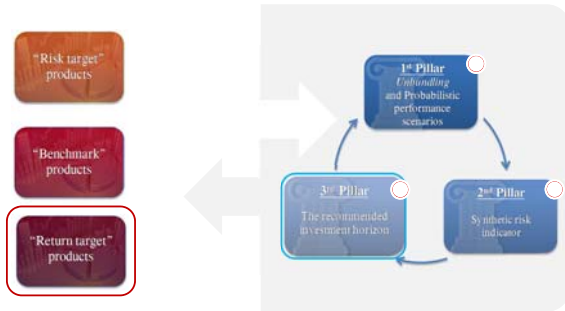

Three-pillars approach: financial structures

In "risk target" or "benchmark" products the degree of risk, together with the costs applied, allows to determine the recommended minimum investment time horizon. This horizon is used as the reference period to calculate the probability scenarios.

Three-pillars approach: financial structures

In “return target” products the target return at a given maturity clearly identifies the investment time horizon (a shorter holding period would compromise the liquidity of the product) w.r.t. which the probability scenarios and the degree of risk are determined.

Marcello Minenna

25

Syllabus

Preliminaries

- ☐ regulatory framework
- ☐ products' risk-return profile VS investors' risk-return profile

Three-pillars approach

☐ financial structures

☒ 1st Pillar: unbundling and performance scenarios

➤ return target products

2nd Pillar: the degree of risk

Synthetic Risk Indicator

... provides a description, on a qualitative scale, of the risk level of the financial products based on volatility measures.

... represents in an explicit way the riskiness of the product embedded in the probabilistic performance scenarios of the first pillar.

2nd Pillar: risk target and benchmark products

The degree of risk of “risk target” and “benchmark” products is initially identified by the intermediary choosing the risk class which he deems to better match the specific features of the product’s financial engineering over the recommended investment time horizon.

During this horizon, the intermediary monitor any possible migration of the degree of risk to a different risk class or, for “benchmark” products, to a different management class (i.e. the intensity of the asset management activity in terms of deviation from the chosen benchmark).

2nd Pillar: risk target and benchmark products

Synthetic Risk Indicator
(The degree of risk)

2nd Pillar: risk target and benchmark products

 Synthetic risk indicator

Mapping of the Qualitative Risk Classes into corresponding Volatility Intervals

Step 3: Fine-tuning of Volatility Intervals: GARCH Diffusive Models

The Weak Convergence Theorem on \mathbb{R}^2

The jump-continuous process $\{X_t^h\}$ whose measurable space is $(\mathbb{R}^2, \mathcal{B}(\mathbb{R}^2))$, converges weakly for $h \downarrow 0$ to the continuous process $\{X_t\}$ which has a unique distribution and is characterized by the following stochastic differential equation:

$$dX_t = b(x, t)dt + \sigma(x, t)dW_{2,t}$$

where $W_{2,t}$ is a two-dimensional standard Brownian motion, if the conditions 1-4 hereafter are satisfied.

Marcello Minenna
73

2nd Pillar: risk target and benchmark products

2nd Pillar
 Synthetic risk indicator

Mapping of the Qualitative Risk Classes into corresponding Volatility Intervals

Step 3: Fine-tuning of Volatility Intervals: GARCH Diffusive Models

Condition 1
If $\exists \delta > 0$ s.t. $\lim_{h \downarrow 0} \begin{pmatrix} c_{h,1}(x_1, t) \\ c_{h,2}(x_2, t) \end{pmatrix} = 0$ then $\exists a(x, t)$ and $b(x, t)$ s.t.:

$$\lim_{h \downarrow 0} \begin{pmatrix} b_h(x_1, t) \\ b_h(x_2, t) \end{pmatrix} = \begin{pmatrix} b(x_1, t) \\ b(x_2, t) \end{pmatrix}$$

$$\lim_{h \downarrow 0} \begin{pmatrix} a_h(x_1, t) & a_h(x_2, t) \\ a_h(x_2, t) & a_h(x_1, t) \end{pmatrix} = \begin{pmatrix} a(x_1, t) & 0 \\ 0 & a(x_2, t) \end{pmatrix}$$

Condition 2
 $\exists \sigma(x, t)$ s.t.: $\forall x_1 \in \mathbb{R}^1, \forall x_2 \in \mathbb{R}^1$ then $\begin{pmatrix} \sigma(x_1, t) & 0 \\ 0 & \sigma(x_2, t) \end{pmatrix} = \begin{pmatrix} \sqrt{a(x_1, t)} & 0 \\ 0 & \sqrt{a(x_2, t)} \end{pmatrix}$

Condition 3
For $h \downarrow 0$, X_0^h converges in distribution to a random variable X_0 with probability measure ν_0 on $(\mathbb{R}^2, \mathcal{B}(\mathbb{R}^2))$

Condition 4
 $\nu_0, a(x, t)$ and $b(x, t)$ uniquely specify the distribution of the process $\{X_t\}$ characterized by an initial distribution ν_0 , a conditional second moment $a(x, t)$ and a conditional first moment $b(x, t)$

Marcello Minenna
74

High	-3.125%	3.125%	-4.668%	4.668%	-6.249%	6.249%
Very High	-6.250%	6.250%	-9.375%	9.375%	-12.500%	12.500%

Syllabus

Preliminaries

- ☐ regulatory framework
- ☐ products' risk-return profile VS investors' risk-return profile

Three-pillars approach

- ☐ financial structures
- ☐ 1st Pillar: unbundling and performance scenarios
 - return target products
 - unbundling
 - probabilistic performance scenarios
 - risk target and benchmark products
 - model risk assessment
- ☒ 2nd Pillar: the degree of risk
 - risk target and benchmark products
 - mapping
 - migration
 - return target products
- ☐ 3rd Pillar: recommended investment time horizon
 - risk target and benchmark products
 - first passage time
 - connection between probability, volatility and costs
 - characterization of the necessary condition in the space of returns
 - how to determine a consistent series of Time Horizons
 - return target products

2nd Pillar: risk target and benchmark products

Migration of the Synthetic Risk Indicator

Migrations of the risk profile are persistent changes either of the degree of risk or of the degree of deviation from the benchmark which can significantly affect investors assessment of the non-equity product.

2nd Pillar: risk target and benchmark products

Migration of the Synthetic Risk Indicator (degree of risk)

2nd Pillar: risk target and benchmark products

Migration of the Synthetic Risk Indicator

In order to correctly detect migrations, the width of both volatility and *delta-vol* intervals must be adequately set with respect to the period taken as a reference to assess the occurrence of these phenomena.

Too wide intervals could result in an artificial reduction in the number of migrations detected.

Too narrow intervals could result in an excessive number of migrations, many of them being spurious.

2nd Pillar: risk target and benchmark products

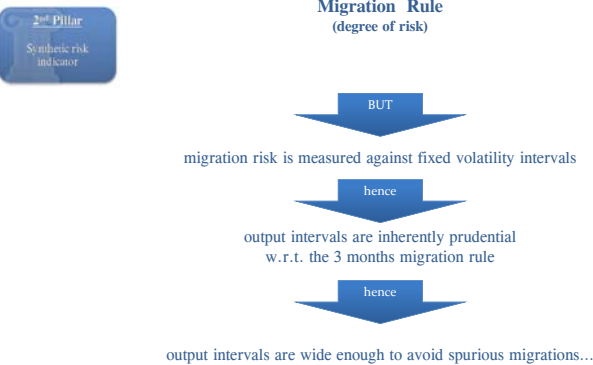

Migration Rule (degree of risk)

the iterative procedure guarantees that a product belonging to a given risk class does not breach the GARCH adaptive band more than 5% of the days in 1 year

no more than 16 days over 250

2nd Pillar: risk target and benchmark products

2nd Pillar: risk target and benchmark products

2nd Pillar: risk target and benchmark products

2nd Pillar: risk target and benchmark products

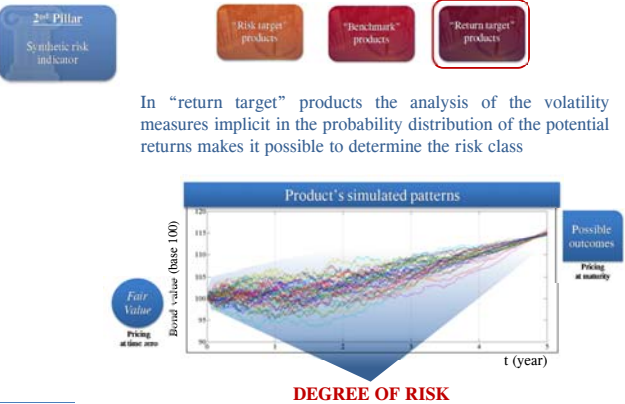

2nd Pillar: risk target and benchmark products

The costs threshold, depending from the presence of redemption's costs, can be variable

Marcello Minenna

118

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

Redemption's costs in percentage γ_k of the Invested Capital, where γ_k is variable with respect to time

Marcello Minenna

119

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

The probability of the event:

The investment recovers the initial costs and off-sets the running costs at least once

given a confidence level α , uniquely identifies a time T^* on the cumulative distribution function of the first passage times, i.e.:

$$T^* = \left\{ T \in \mathfrak{R}^+ : \mathbb{P}[t^* \leq T] = \alpha \right\}$$

where

$$t^* = \inf \left[t \in \mathfrak{R}^+ : CI_t > CN \right]$$

is the first passage time

Marcello Minenna

120

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

1. Calculation of the probability distribution of the first passage times:

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

2. Derivation of the cumulative distribution function of the first passage times:

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

3. The confidence level α uniquely identifies T^* on the cumulative distribution function of the first passage times:

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

3. The discretization step is relevant in the determination of the cumulative probability function, conditioning the identification of the time horizon, given a fixed level of confidence:

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

When many probability distribution functions are considered, letting varying volatilities and costs, the problem of correctly identifying a set of minimum thresholds arises:

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

Anyway, the recommended minimum investment time horizon...

$$T^* = \left\{ T \in \mathcal{R}^+ : P[t^* \leq T] = \alpha \right\}$$

.... Must be coherent with the principle

+ VOLATILITY' + TIME HORIZON

3rd Pillar: recommended investment time horizon

Anyway, the recommended minimum investment time horizon...

$$T^* = \left\{ T \in \mathfrak{R}^+ : \mathbb{P}[t^* \leq T] = \alpha \right\}$$

.... Must be coherent with the principle

+ VOLATILITY' + TIME HORIZON

The correct way to solve the problem is to set up an operative procedure to select properly each threshold according to the above principle

Syllabus

Preliminaries

- ☐ regulatory framework
- ☐ products' risk-return profile VS investors' risk-return profile

Three-pillars approach

- ☐ financial structures
- ☐ 1st Pillar: unbundling and performance scenarios
 - return target products
 - unbundling
 - probabilistic performance scenarios
 - risk target and benchmark products
 - model risk assessment
- ☐ 2nd Pillar: the degree of risk
 - risk target and benchmark products
 - mapping
 - migration
 - return target products
- ☒ 3rd Pillar: recommended investment time horizon
 - risk target and benchmark products
 - first passage time
 - **connection between probability, volatility and costs**
 - characterization of the necessary condition in the space of returns
 - how to determine a consistent series of Time Horizons
 - return target products

3rd Pillar: recommended investment time horizon

Connection between probability, volatility and costs

First passage times for the break-even barrier are monitored at infinitesimal time intervals:

$$T^* = \left\{ T \in \mathfrak{R}^+ : \mathbb{P}[t^* \leq T] = \alpha \right\}$$

$$\mathbb{P}[t^* \leq T] = N\left(d_2\left(\frac{CN}{CI_0}\right)\right) + \left(\frac{CN}{CI_0}\right)^{\frac{2(\bar{r}-cr)}{\sigma^2}-1} \cdot N\left(-d_2\left(\frac{CN}{CI_0}\right)\right)$$

$$d_2(x) = \frac{\log x + \left(\bar{r} - cr - \frac{1}{2}\sigma^2\right)T}{\sigma\sqrt{T}}$$

$$N(x) = \int_{-\infty}^x \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2}z^2} dz$$

$dt \rightarrow 0$

3rd Pillar: recommended investment time horizon

Connection between probability, volatility and costs

Asymptotic properties: $T \rightarrow \infty$

cr : recurrent costs as a fixed %

$$\lim_{T \rightarrow \infty} \mathbb{P}[t^* \leq T] = \begin{cases} 1 & \text{if } (\bar{r} - cr) \geq \frac{1}{2}\sigma^2 \\ \left(\frac{CN}{CI_0}\right)^{\frac{2(\bar{r}-cr)}{\sigma^2}-1} & \text{if } (\bar{r} - cr) < \frac{1}{2}\sigma^2 \end{cases}$$

3rd Pillar: recommended investment time horizon

Connection between probability, volatility and costs

Under our assumptions:

$$\lim_{T \rightarrow \infty} \mathbb{P}[t^* \leq T] = \begin{cases} 1 & \text{if } (\bar{r} - cr) \geq \frac{1}{2}\sigma^2 \\ \left(\frac{CN}{CI_0}\right)^{\frac{2(\bar{r}-cr)}{\sigma^2}-1} & \text{if } (\bar{r} - cr) < \frac{1}{2}\sigma^2 \end{cases}$$

For a given level of costs, it is possible to analytically derive the connection between volatility and time horizon

3rd Pillar: recommended investment time horizon

Connection between probability, volatility and costs

$T \rightarrow \infty, dt \rightarrow 0$

FIRST ORDER SENSITIVITY ANALYSIS

$$\frac{dP}{d\sigma} = \left(-4 \frac{(\bar{r} - cr)}{\sigma^3} \ln\left(\frac{CN}{CI_0}\right) \left(\frac{CN}{CI_0}\right)^{\frac{2(\bar{r}-cr)}{\sigma^2}-1} \right)$$

FIRST ORDER ASYMPTOTIC CONDITION

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

Connection between probability, volatility and costs

$$T \rightarrow \infty, dt \rightarrow 0$$

$$\frac{dP}{d\sigma} = \left(-4 \frac{(\bar{r} - cr)}{\sigma^3} \ln \left(\frac{CN}{CI_0} \right) \left(\frac{CN}{CI_0} \right)^{\frac{2(\bar{r} - cr)}{\sigma^2} - 1} \right)$$

1. $(\bar{r} - cr) > 0 \Leftrightarrow \frac{dP}{d\sigma} < 0$
2. $(\bar{r} - cr) \leq 0 \Leftrightarrow \frac{dP}{d\sigma} \geq 0$

The existence of two alternative states of nature requires to verify whether both of them make sense in financial terms under the risk-neutral measure.

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

Connection between probability, volatility and costs

$$T \rightarrow \infty, dt \rightarrow 0$$

$$\frac{dP}{d\sigma} = \left(-4 \frac{\bar{r}}{\sigma^3} \ln \left(\frac{CN}{CI_0} \right) \left(\frac{CN}{CI_0} \right)^{\frac{2\bar{r}}{\sigma^2} - 1} \right)$$

1. $\bar{r} > 0 \Leftrightarrow \frac{dP}{d\sigma} < 0$
2. $\bar{r} \leq 0 \Leftrightarrow \frac{dP}{d\sigma} \geq 0$

$cr = 0$

Being running costs a specific feature of any financial product they would interfere with the task of identifying which of the two conditions has a sound financial meaning. Therefore, they will be temporarily neglected.

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

Connection between probability, volatility and costs

$$T \rightarrow \infty, dt \rightarrow 0$$

$$\frac{dP}{d\sigma} = \left(-4 \frac{\bar{r}}{\sigma^3} \ln \left(\frac{CN}{CI_0} \right) \left(\frac{CN}{CI_0} \right)^{\frac{2\bar{r}}{\sigma^2} - 1} \right)$$

1. $\bar{r} > 0 \Leftrightarrow \frac{dP}{d\sigma} < 0$
2. $\bar{r} \leq 0 \Leftrightarrow \frac{dP}{d\sigma} \geq 0$

$cr = 0$

Since it is safe to assume a positive interest rate r in financial markets, only condition 1. correctly captures the connection between volatility and time horizon.

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

Connection between probability, volatility and costs

$$T \rightarrow \infty, dt \rightarrow 0$$

$$\frac{dP}{d\sigma} = \left(-4 \frac{\bar{r}}{\sigma^3} \ln \left(\frac{CN}{CI_0} \right) \left(\frac{CN}{CI_0} \right)^{\frac{2\bar{r}}{\sigma^2} - 1} \right)$$

1. $\bar{r} > 0 \Leftrightarrow \frac{dP}{d\sigma} < 0$
2. $\bar{r} \leq 0 \Leftrightarrow \frac{dP}{d\sigma} \geq 0$

$cr = 0$

As $T \rightarrow \infty$ condition 1. implies that the cumulative distribution function P is a strictly decreasing function of the volatility, i.e.:

$$\forall \sigma_i, \sigma_j \in \mathbb{R}^+, \sigma_j > \sigma_i \Rightarrow P(\sigma_j) < P(\sigma_i)$$

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

Connection between probability, volatility and costs

$$T \rightarrow \infty, dt \rightarrow 0$$

$$\frac{dP}{d\sigma} = \left(-4 \frac{\bar{r}}{\sigma^3} \ln \left(\frac{CN}{CI_0} \right) \left(\frac{CN}{CI_0} \right)^{\frac{2\bar{r}}{\sigma^2} - 1} \right)$$

1. $\bar{r} > 0 \Leftrightarrow \frac{dP}{d\sigma} < 0$
2. $\bar{r} \leq 0 \Leftrightarrow \frac{dP}{d\sigma} \geq 0$

$cr = 0$

In other words, for a given a confidence level, as the volatility grows, the recommended investment time horizon increases as well:

+VOLATILITY + RECOMMENDED INVESTMENT TIME HORIZON

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

Connection between probability, volatility and costs

$$T \rightarrow \infty, dt \rightarrow 0$$

$$\frac{dP}{d\sigma} = \left(-4 \frac{\bar{r}}{\sigma^3} \ln \left(\frac{CN}{CI_0} \right) \left(\frac{CN}{CI_0} \right)^{\frac{2\bar{r}}{\sigma^2} - 1} \right)$$

1. $\bar{r} > 0 \Leftrightarrow \frac{dP}{d\sigma} < 0$
2. $\bar{r} \leq 0 \Leftrightarrow \frac{dP}{d\sigma} \geq 0$

$cr = 0$

$$\exists T^* \in [0, \infty[: \frac{dP}{d\sigma} = 0$$

Furthermore, condition 1. alone is sufficient to guarantee a minimum time T^* beyond which the following strong condition holds:

+VOLATILITY + RECOMMENDED INVESTMENT TIME HORIZON

SECOND ORDER ASYMPTOTIC CONDITION

Second Order Sensitivity Analysis

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

Connection between probability, volatility and costs

$$T \rightarrow \infty, dt \rightarrow 0$$

1. $\begin{cases} (\bar{r} - cr) > 0 \Leftrightarrow \frac{dP}{d\sigma} < 0 \\ (\bar{r} - cr) > 0 \Rightarrow \frac{d^2P}{d\sigma^2} > 0 \end{cases}$

2. $(\bar{r} - cr) \leq 0 \Leftrightarrow \frac{dP}{d\sigma} \geq 0$

$\exists T^* \in [0, \infty[: \frac{dP}{d\sigma} = 0$

Summarizing the results of the asymptotic analysis in continuous time:

- As $T \rightarrow \infty$, for a given a confidence level, more volatility implies a larger recommended investment time horizon
- It is always possible to find a minimum and finite time T^* , beyond which the strong condition

+VOLATILITY + RECOMMENDED INVESTMENT TIME HORIZON holds

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

Connection between probability, volatility and costs

$$T \rightarrow \infty, dt \rightarrow 0$$

1. $\begin{cases} (\bar{r} - cr) > 0 \Leftrightarrow \frac{dP}{d\sigma} < 0 \\ (\bar{r} - cr) > 0 \Rightarrow \frac{d^2P}{d\sigma^2} > 0 \end{cases}$

2. $(\bar{r} - cr) \leq 0 \Leftrightarrow \frac{dP}{d\sigma} \geq 0$

$\bar{T} = x \text{ years}$

It is necessary to drop from the analysis those cases which yield condition 2 (i.e. whenever the drift positiveness is not satisfied). Under such a condition, the recommended time horizon is set by default equal to a pre-defined limit x .

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

DETERMINATION OF THE INVESTMENT TIME HORIZON

General Framework:

$$\begin{cases} T \rightarrow \infty \\ dt \rightarrow 0 \\ P(\infty, \sigma) \end{cases} \Rightarrow \begin{cases} T \text{ finite} \\ dt \rightarrow 0 \\ P(T, \sigma) \end{cases}$$

$$\begin{cases} (\bar{r} - cr) > 0 \Leftrightarrow \frac{dP}{d\sigma} < 0 \\ (\bar{r} - cr) > 0 \Rightarrow \frac{d^2P}{d\sigma^2} > 0 \end{cases} \Rightarrow \begin{cases} (\bar{r} - cr) > 0 \Leftrightarrow \lim_{T \rightarrow \infty} \frac{\partial P(T, \sigma)}{\partial \sigma} < 0 \\ (\bar{r} - cr) > 0 \Rightarrow \lim_{T \rightarrow \infty} \frac{\partial^2 P(T, \sigma)}{\partial \sigma^2} > 0 \end{cases}$$

In order to determine effectively the investment time horizon, it is necessary to abandon the asymptotic environment and to shift the analysis of condition 1. in a finite time's framework.

3rd Pillar: recommended investment time horizon

3rd Pillar
The recommended investment horizon

DETERMINATION OF THE INVESTMENT TIME HORIZON

FIRST ORDER SENSITIVITY ANALYSIS

$\frac{\partial P(T, \sigma)}{\partial \sigma}$

At a finite time T , the asymptotic relationship $\lim_{T \rightarrow \infty} \frac{\partial P(T, \sigma)}{\partial \sigma} < 0$ determines the existence and the unicity of a time:

$$T_{\sigma}^* = \inf \left\{ T \in [0, \infty[: \frac{\partial P(T, \sigma)}{\partial \sigma} \Big|_{\sigma=\bar{\sigma}} < 0 \right\}$$

such that:

$$(\bar{r} - cr) > 0 \Rightarrow \begin{cases} \frac{\partial P(T, \sigma)}{\partial \sigma} \Big|_{\sigma=\bar{\sigma}} > 0 & \text{if } 0 \leq T < T_{\sigma}^* \\ \frac{\partial P(T, \sigma)}{\partial \sigma} \Big|_{\sigma=\bar{\sigma}} \leq 0 & \text{if } T \geq T_{\sigma}^* \end{cases}$$

3rd Pillar: recommended investment time horizon

DETERMINATION OF THE INVESTMENT TIME HORIZON

FIRST ORDER SENSITIVITY ANALYSIS

$\frac{\partial P(T, \sigma)}{\partial \sigma}$

At a finite time T , the sufficient condition of the first order that allows to state the core relationship

+ volatility + time horizon

is then specified in the following form:

$\left. \frac{\partial P(T, \sigma)}{\partial \sigma} \right|_{\sigma=\bar{\sigma}} > 0$

$\text{if } 0 \leq T < T_{\bar{\sigma}}^*$

$\left. \frac{\partial P(T, \sigma)}{\partial \sigma} \right|_{\sigma=\bar{\sigma}} \leq 0$

$\text{if } T \geq T_{\bar{\sigma}}^*$

DETERMINATION OF THE INVESTMENT TIME HORIZON

SECOND ORDER SENSITIVITY ANALYSIS

$$\frac{\partial^2 P(T, \sigma)}{\partial \sigma^2}$$

Given the monotonicity condition of the probability distribution with respect to volatility, i.e.:

$$\forall \sigma_i, \sigma_j \in \mathfrak{R}^+, \sigma_j > \sigma_i \Rightarrow P(\infty, \sigma_j) < P(\infty, \sigma_i)$$

In order to fulfill this condition, it's necessary to restrict the analysis in the region where the probability function is strictly increasing, i.e.:

$$\left. \frac{\partial^2 P(T, \sigma)}{\partial \sigma^2} \right|_{T=T_{\sigma}^*} > 0 \Rightarrow T_{\sigma}^* \text{ increasing}$$

$$\left. \frac{\partial^2 P(T, \sigma)}{\partial \sigma^2} \right|_{T=T_{\sigma}^*} < 0 \Rightarrow T_{\sigma}^* \text{ decreasing}$$

STRONG CONVERGENCE LEMMA for times

Given a sequence of financial products F_j with volatility σ_j and recalling the first order sufficient condition:

$$T_{\sigma}^* = \max \left\{ T_{\min}, T : \frac{\partial P(T, \sigma)}{\partial \sigma} = 0 \right\}, \quad \forall \sigma \in \mathfrak{R}^+$$

the first order sufficient condition can be specified for the class of products F_j in the following form:

$$T_{\sigma_j}^{\varepsilon_j} : P(T_{\sigma_j}^{\varepsilon_j}, \sigma_{j+1}) = P(T_{\sigma_j}^{\varepsilon_j}, \sigma_j)$$

It therefore holds the following strong convergence relation with respect to times:

$$\lim_{\sigma_{j+1} \rightarrow \sigma_j} T_{\sigma_j}^{\varepsilon_j} = T_{\sigma_j}^*$$

where $\varepsilon_j = (\sigma_{j+1} - \sigma_j) > 0$.
